WHAT IS ICF?

Buildings constructed with Insulated Concrete Forms (ICF) are built with a super-insulated shell which can span from the foundation to the eaves.

ICF construction saves time by combining 3 of the most time-consuming parts of construction – framing, insulating and pouring concrete. It also uses less lumber for a more sustainable, green construction process.

BENEFITS OF ICF

ICF structures use 40-80% less energy to operate, providing substantial long-term value. They are better rated for fire safety and provide more insulation R-Value than any other type of construction.

You've never been more comfortable than in an ICF building! They are 99% air tight and reduce sound transmission by 75%. ICF can be finished with any exterior or interior material!

Options

The options for building with ICF are virtually endless! From basements to full-custom home layouts to unique finishing touches, ICF lets your ideas and preferences flourish!

Costs

Custom ICF homes cost about 7% more than wood-framing. When you compare it with your energy savings, lower insurance rates and better protection, it's worth every penny!

Planning

Planning an ICF building with Turtle Wall is easy! They don't require special engineering and our decade of experience means we make the entire process efficient and streamlined.

Why Hire an ICF Professional?

While you can buy ICF blocks direct from manufacturers who make the process look easy – IT'S NOT!

The ICF building process requires the right knowledge and tools to avoid unrepairable, structural problems.

Turtle Wall has been building ICF homes and buildings since 2005. Contact us today for a free estimate.

All savings shown are estimates. Your actual savings will vary.
